

A  
“Project Documentarion”  
On  
**Hospital Management System**

## **1. INTRODUCTION:**

A hospital is a health care institution providing patients treatment with specialized medical and nursing staff and medical equipment. The best-known type of hospital is the general hospital, which typically has an emergency department to treat urgent health problems. Ranging from fire accident victims to a sudden illness.

The hospital system include registration of patients, storing their details into the system and also computerised billing in the pharmacy and labs.

Hospital Website is a software product suite designed to improve the quality and management of hospital website in the area of clinical process analysis and activity-based costing. Managing the key processes efficiently is critical to the success of the hospital helps you manage your process.

## **2. Goals:**

- \* User friendly.
- \* Simple fast.
- \* Low cost and effective.
- \* It deals with the collection of patient's information.

## **3. Objective:**

- Define hospital.
- Recording information about patient that come.
- Generating bills.
- Recording information related to diagnosis given to patients.
- Keeping information about various and medicines available to cure them.

## **4. Scope of the project:**

- Information about patient is done by just writing the patient name, age and gender. Whenever the patient come up his information is stored freshly.
- Bills are generated by recording price for each facility provided to patient on a separate sheet at the last they all are summed up.
- Information about various diseases is not kept as any document. Doctors themselves do this job by remembering various medicines.
